Kirigami parachute: every geometry tried and where it failed

39 runs on 17 distinct shapes; 8 finished with a valid Cd. Canopy builds: legacy (original), clean (fused slabs), lattice (pinned joints).

Outcomes

solver diverged (stopped by guard): 9 (0021, 0024, 0030, 0033, 0034, 0036, 0037, 0038, 0039)

ok: 8 (0002, 0005, 0009, 0011, 0013, 0023, 0025, 0028)

mesher failed: 6 (0003, 0004, 0006, 0022, 0026, 0027)

solver diverged (crashed): 6 (0007, 0012, 0017, 0031, 0032, 0035)

solver diverged (garbage Cd): 6 (0008, 0014, 0015, 0016, 0018, 0020)

not run (cost estimate over the cap): 1 (0001)

pipeline / API error (not the geometry): 1 (0010)

solver not converged: 1 (0019)

mesh cap hit (cancelled): 1 (0029)

What the positions say

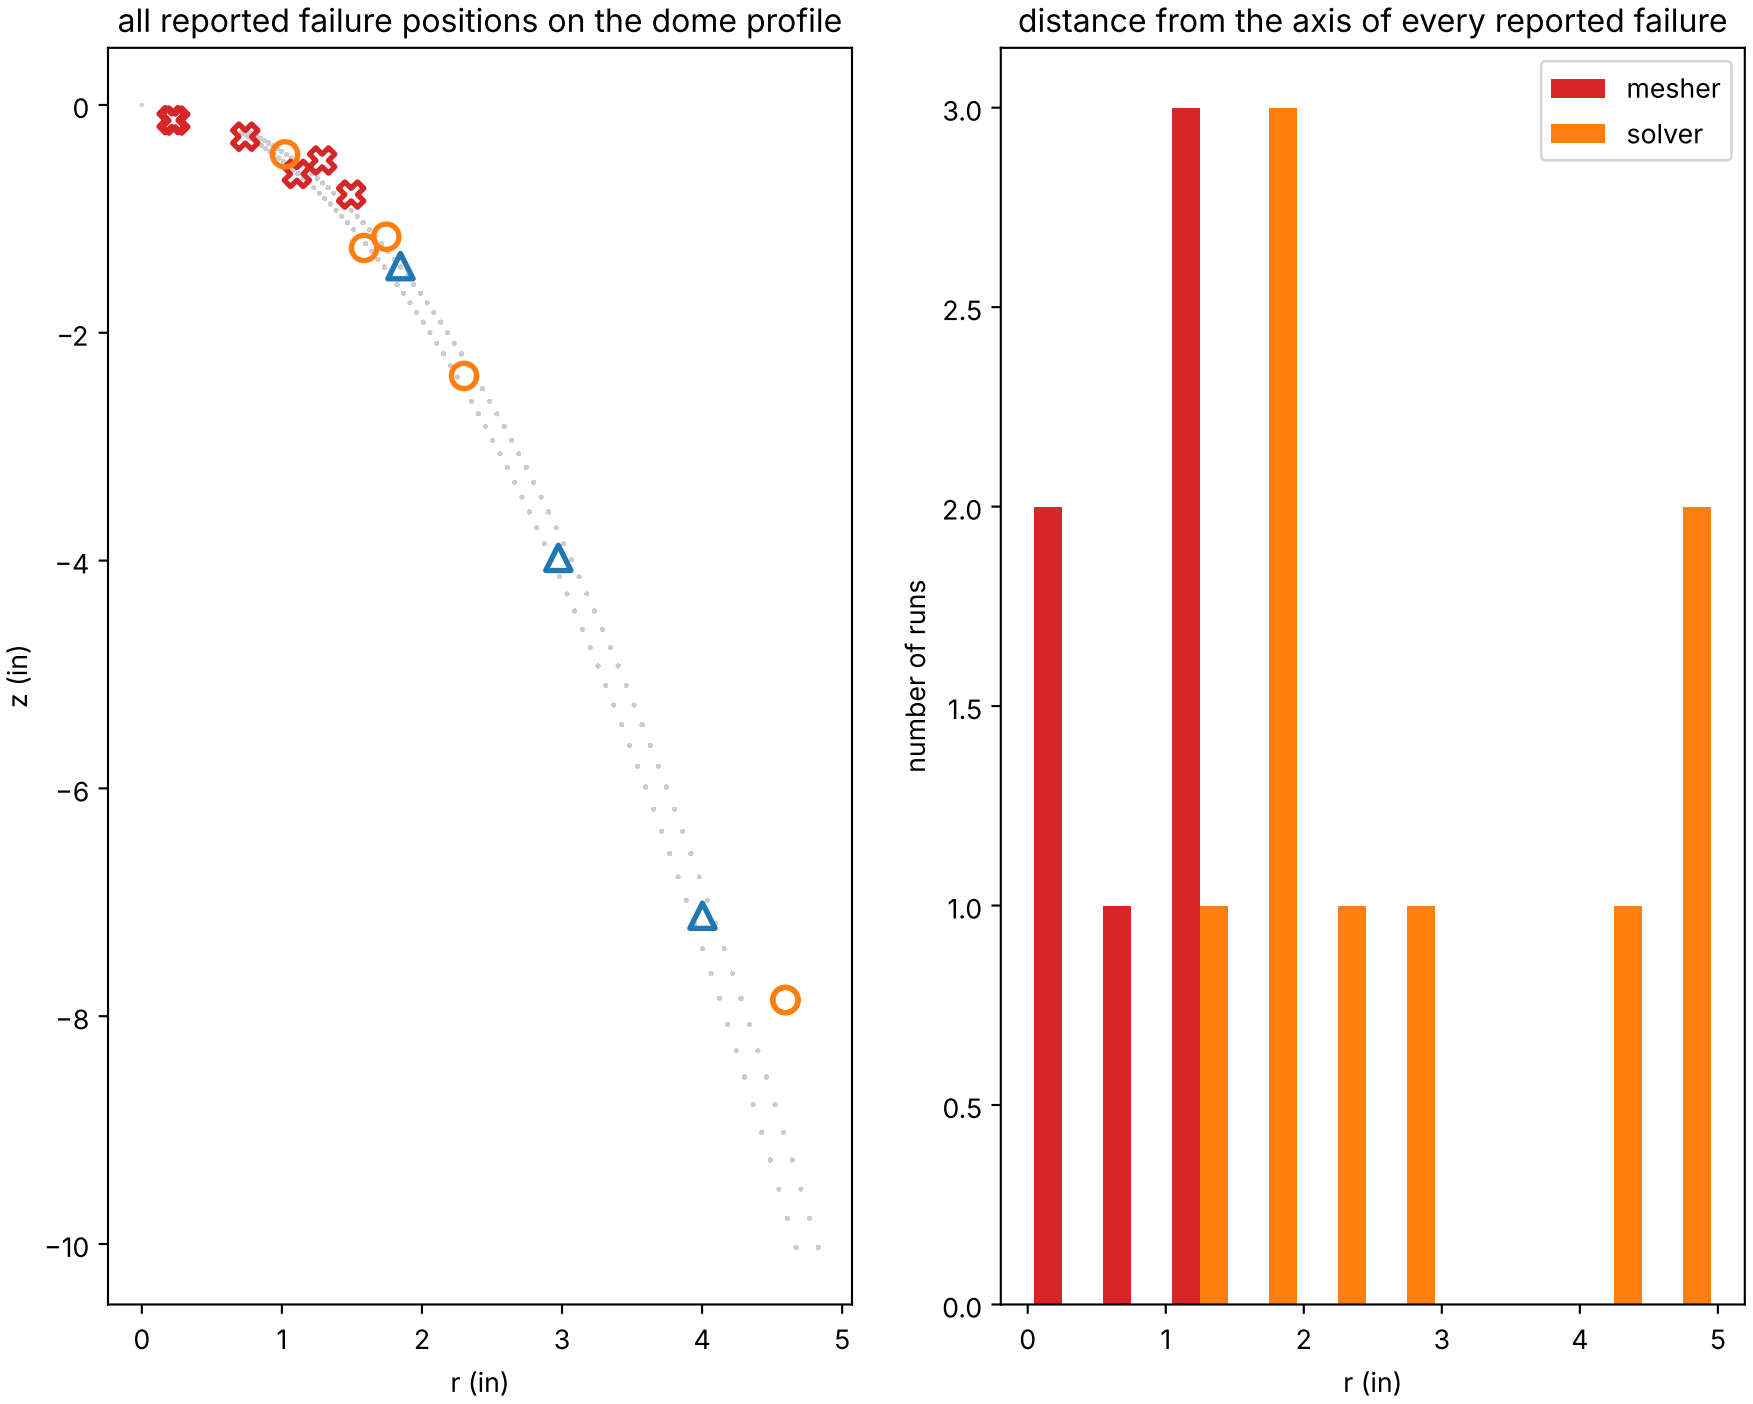

- Mesher failures (red X) all sit within 1.5 in of the apex: the centre cap and the first rings (the old builds' crossing triangles and slivers).

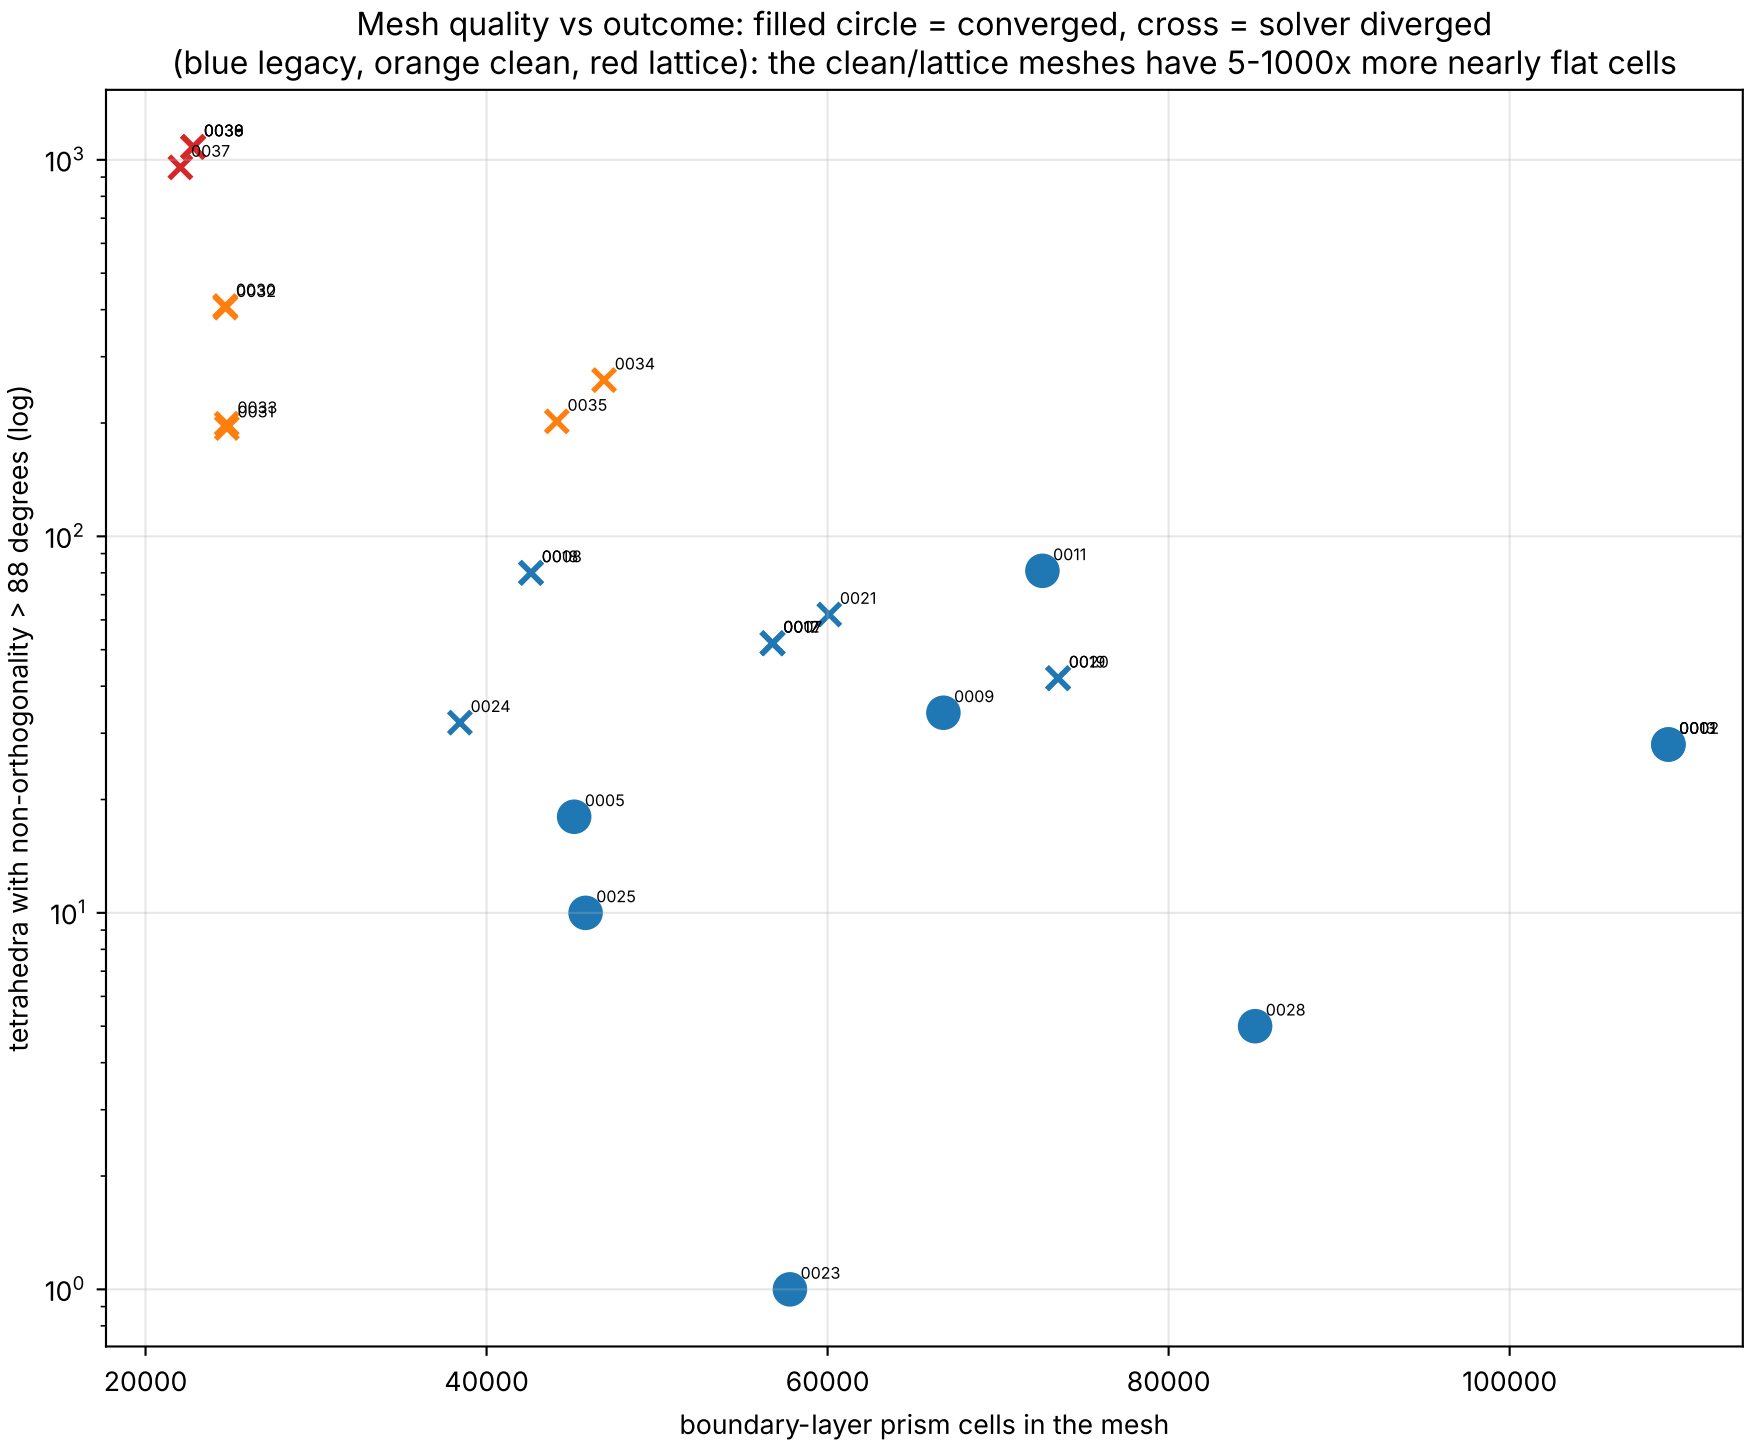

- Solver blow-ups (orange / blue) are spread over r 1.0 - 4.6 in, on a different ribbon in each run; they follow the same designs across builds, not one spot.

- Runs 0001, 0010, 0014-0016 and 0019 were pipeline / settings problems, not geometry; 0029 hit the mesh CPU cap.

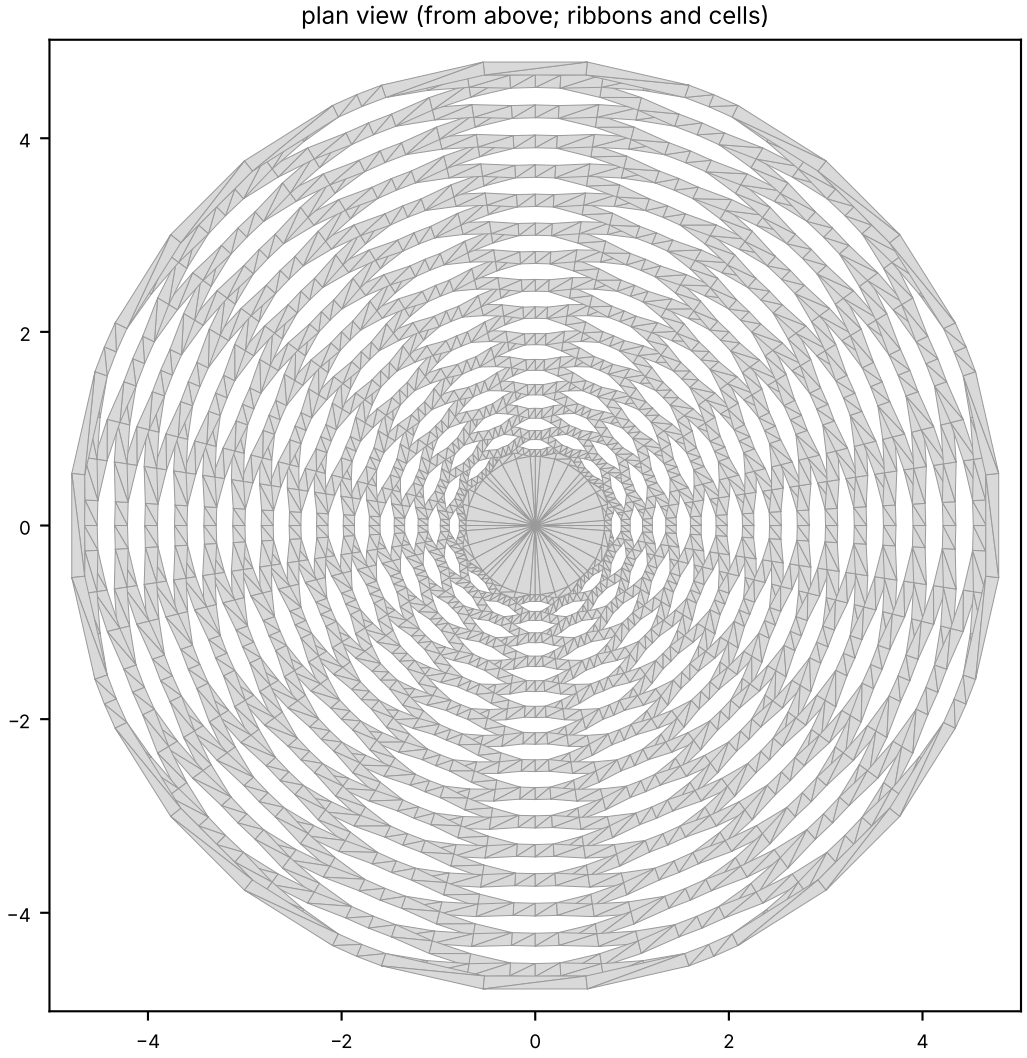

- Valid Cds (8 runs) all came from the legacy build; no clean- or lattice-build run has converged yet.

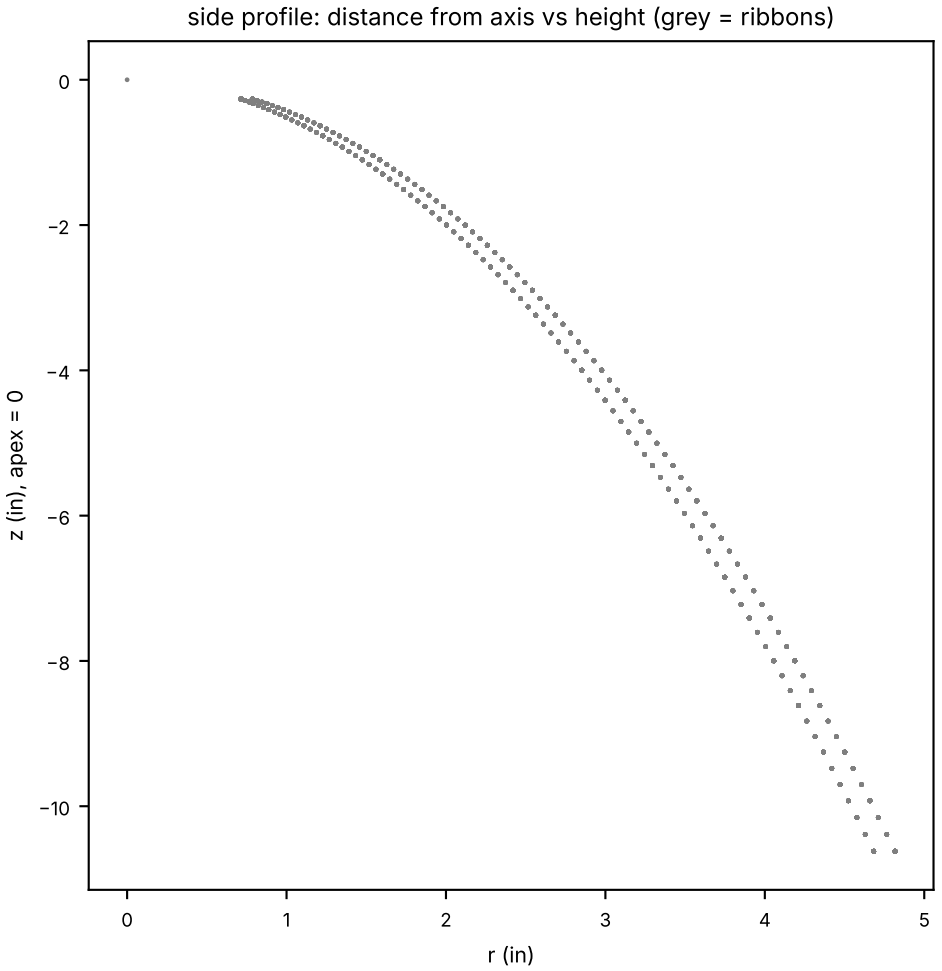

- Mesh quality is the common factor: converged runs had at most 81 nearly-flat tetrahedra (non-orthogonality > 88 deg); clean/lattice meshes had 190-1100 and half the boundary-layer cel
